

Hermes + TradingView MCP

+ Hyperliquid MCP

No webhooks. No manual execution. Hermes reads chart data directly and trades autonomously 24/7.

BEFORE YOU START

- Hermes Agent on myhermes.cloud (one-click deploy)
- Hyperliquid account with funds deposited
- OpenRouter API key — Kimi K2.6 recommended (\$0.95/M tokens)
- Telegram bot token (optional but strongly recommended)

STEP 01

DEPLOY HERMES ON MYHERMES.CLOUD

myhermes.cloud is a one-click managed host for Hermes Agent. No Docker, no terminal. Your agent runs 24/7 and stays alive even when your devices are off — that is what makes the whole system possible.

1. Go to myhermes.cloud → Deploy Agent
2. Connect your OpenRouter key → select Kimi K2.6 (moonshotai/kimi-k2.6)
3. Enable Telegram and paste your bot token
4. Your agent is live

Why myhermes.cloud? A local Hermes goes offline when your laptop does. myhermes.cloud keeps it running continuously so it never misses a signal.

STEP 02

ADD TRADINGVIEW MCP TO HERMES

TradingView MCP gives your Hermes agent the ability to read live chart data — indicators, OHLCV candles, and signals — directly from TradingView without any webhooks or external scripts.

IN HERMES DASHBOARD → MCP SERVERS → ADD SERVER, PASTE THIS CONFIG:

```
{
  "mcpServers": {
    "tradingview": {
      "command": "uvx",
      "args": [
        "--from",
        "mcp-tradingview-server",
        "mcp-tradingview"
      ]
    }
  }
}
```

What this gives Hermes:

1. `get_indicators` — reads RSI, EMA, MACD, SuperTrend etc.
2. `get_ohlc` — pulls live candle data for any timeframe
3. `get_signals` — reads TradingView's built-in buy/sell signals

No TradingView account required for basic indicators. TradingView Premium unlocks access to custom Pine Script signals.

STEP 03

ADD HYPERLIQUID MCP TO HERMES

Hyperliquid MCP is what actually places and manages trades. Once Hermes has read the chart data, it calls Hyperliquid MCP to execute positions, set stop-losses, and check open orders — all without you touching anything.

ADD THIS TO THE SAME MCP CONFIG:

```
{
  "mcpServers": {
    "hyperliquid": {
      "command": "npx",
      "args": ["-y", "hyperliquid-mcp"],
      "env": {
        "HL_PRIVATE_KEY": "your_api_wallet_private_key",
        "HL_WALLET_ADDRESS": "your_main_wallet_address"
      }
    }
  }
}
```

Security tip: Use a separate API wallet on Hyperliquid, not your main wallet private key. Go to Hyperliquid → Settings → API Keys to generate one with limited permissions.

What Hyperliquid MCP can do:

1. `place_order` — market or limit orders on any perp
2. `cancel_order` — cancel pending orders
3. `get_positions` — check open positions + PnL
4. `set_leverage` — adjust position leverage per trade

STEP 04

WRITE YOUR TRADING STRATEGY PROMPT

This is the most important step. Your Hermes system prompt defines exactly how the agent thinks, what signals it reads, when it enters and exits, and how it manages risk. Write it clearly — Hermes executes it exactly as written.

PASTE THIS INTO HERMES → SYSTEM PROMPT:

You are an autonomous trading agent with access to TradingView MCP and Hyperliquid MCP. Run continuously every 15 minutes.

Each cycle:

1. Call `tradingview.get_indicators` for BTC/USDT on the 1h timeframe
2. Read EMA 20 and EMA 50 values
3. If $\text{EMA } 20 > \text{EMA } 50$ and $\text{RSI}(14)$ is between 45-65:
 - Check current Hyperliquid position
 - If no long position: `place_order BUY $50 market, 5x leverage`
4. If $\text{EMA } 20 < \text{EMA } 50$ and there is an open long:
 - `place_order SELL` to close position
5. Send Telegram notification after every trade action

Risk rules:

- Maximum 1 open position at a time
- Stop loss: 2% below entry
- Take profit: 4% above entry

Never take a position larger than \$100 notional.

For custom strategies: DM me on Twitter/X @govindgoel for a personalised strategy prompt built around your risk tolerance and preferred indicators.

STEP 05

TEST WITH PAPER TRADING FIRST

Before going live with real money, run your strategy on Hyperliquid's testnet. Same interface, same MCP tools, fake funds.

1. Visit app.hyperliquid.xyz/testnet and connect your wallet
2. Claim testnet USDC from the faucet
3. Change `HL_PRIVATE_KEY` in your MCP config to your testnet API key
4. Run Hermes for 24-48 hours and review the trade log in Telegram
5. Once profitable in testnet → switch back to mainnet key

Hyperliquid testnet is identical to mainnet in terms of order flow and latency. If your strategy works in testnet, it will behave the same way live.

BONUS

READY-TO-USE STRATEGY PROMPTS

Copy any of these directly into your Hermes system prompt. Each one is a complete, self-contained strategy.

Strategy 1 — EMA Crossover (Trend Following)

```
Every 30 minutes, check BTC/USDT 1h chart via TradingView MCP.  
Buy when EMA20 crosses above EMA50 + RSI between 45-65.  
Sell when EMA20 crosses below EMA50.  
Max position $100, stop loss 2%, take profit 4%.  
Send Telegram notification on every trade.
```

Strategy 2 — RSI Reversal (Mean Reversion)

```
Every 15 minutes, check ETH/USDT 15m chart via TradingView MCP.  
Buy when RSI(14) drops below 30 (oversold) and price is above EMA200.  
Sell when RSI rises above 55 or position is up 3%.  
Stop loss: 1.5% below entry. Max 1 position at a time.
```

Strategy 3 — SuperTrend (Momentum)

```
Every hour, check SOL/USDT 4h chart via TradingView MCP.  
Enter long when SuperTrend flips bullish (direction = 1).  
Exit when SuperTrend flips bearish (direction = -1).  
Use 3x leverage. Position size $75. Notify me via Telegram  
with entry price, direction, and indicator values on every trade.
```

Deploy your Hermes trader today

One-click deploy. No servers. No Docker. Runs 24/7 even when your laptop is off.
